

PREMIUM LINE

QUALITY

SAFETY

EFFICACY

The production method has been improved in order to guarantee a **rich** and **characterized phytocomplex**.

PREMIUM extracts are **standardized** and **titrated**.

The DER of PREMIUM extracts varies according to the titration of **drug's active compounds**. Consequently, the dosage is not only based on DER, but it depends on the active compounds concentration.

The PREMIUM extracts should be used with **lower dosages** than traditional ones, thanks to the concentrated source of compounds with biological and physiological activity.

TRADITIONAL
FLUID
EXTRACT

Traditional extracts are produced with a standard 1:1 Drug Extract Ratio (DER) and do not have a characterized phytocomplex.

Traditional extracts are standardized but not titrated.

Traditional extracts have a fixed DER 1:1; this is the reason why DER represents the only parameter to establish the dosage.

Traditional extracts are used with higher dosages than PREMIUM ones, since they are not chemically characterized.
